Brain Health Corner: Dr. Miller's Tips

To Think Better, Feel More!

"When we have an emotional reaction to something, we are more likely to remember the information. This means that if something is interesting, funny, scary, or extremely pleasant, we are more likely to encode (learn) the new information. To strengthen our memory, we can take a moment to think about how we "feel" about the new information (are we pleased, surprised, upset), and then we are more likely to recall the newly encoded information."
